

Inspired by the French word for “tight” Tendu PN + HA combines nature and science to help repair and restore tired skin while improving skin texture, tone and elasticity from the inside out. Tendu PN + HA combines the best of both worlds—Polynucleotides (PN), which are known for their advanced skin regeneration properties, and Hyaluronic Acid (HA) for intense hydration.

PN is up to 10 times stronger than PDRN, making it a more potent solution for skin rejuvenation, repair, and overall anti-aging benefits.

Each 5ml vial delivers a high concentration of active ingredients, leading to faster and longer-lasting results with fewer treatments compared to other products. This means that you can offer your patients better outcomes with less frequent sessions.

Polynucleotides are biocompatible and highly safe, reducing the risk of adverse reactions. With clinical papers supporting the efficacy of PN in advanced skin treatments, you can confidently present this as a cutting-edge solution backed by science.

Polynucleotide (PN) offer several benefits for skin rejuvenation and regeneration:

- **Collagen and elastin production:** Polynucleotides stimulate fibroblast cells to boost the production of collagen and elastin, improving skin tone and elasticity.
 - **Tissue regeneration:** They enhance tissue regeneration and repair, helping to improve overall skin quality.
 - **Hydration:** Polynucleotides have a hydrating effect, increasing the skin's moisture retention capabilities.
 - **Antioxidant properties:** They act as powerful antioxidants, scavenging free radicals and reducing inflammation in the skin.
 - **Skin texture improvement:** Polynucleotides help improve skin texture, reducing the appearance of fine lines, wrinkles, and pores.
 - **Cell renewal:** They stimulate cell renewal, leading to improved skin glow and overall appearance.
 - **Wound healing:** Polynucleotides act as wound healing agents, helping to improve scars, reduce stretch marks, and address various skin texture concerns.
 - **Even skin tone:** By promoting repair mechanisms, polynucleotides can help improve skin discoloration and create a more even tone.
- **Mild volumizing effect:** While not as pronounced as dermal fillers, polynucleotides can produce a mild increase in volume and skin tightening.
 - **Versatility:** Polynucleotides can be used on various areas of the face and body, including under-eye areas, forehead, neck, décolletage, and even the scalp for hair regrowth.
